Common Sections Covered in the Exploration Frog Dissection Lab

The dissection typically involves examining multiple body systems, each with specific structures and functions. The answer key helps clarify these components, which are often grouped into sections:

- External Anatomy** Identifying body parts such as the snout, eyes, tympanic membrane, limbs, and skin texture. Describing the function of external features like the cloaca and webbed feet.
- Internal Anatomy** Examining the digestive system: mouth, esophagus, stomach, intestines, liver, pancreas. Exploring the respiratory system: lungs, buccal cavity, glottis. Investigating the circulatory system: heart, blood vessels. Observing the excretory system: kidneys, cloaca. Understanding the reproductive system: testes or ovaries depending on the specimen.

Key Questions and Answers in the Exploration Frog Dissection Lab

The lab guide usually includes questions designed to test comprehension and observational skills. Below are some common questions along with detailed answers provided by the answer key.

- What are the major external features of the frog, and what are their functions?
 - Snout:** The pointed part of the head used for sensing and biting.
 - Eyes:** Provide vision and help detect movement and predators.
 - Tympanic membrane:** External eardrum that detects sound vibrations.
 - Limbs:** Used for movement; front limbs assist in balance, hind limbs enable jumping.
 - Skin:** Functions in respiration, protection, and moisture retention.
 - Cloaca:** A common opening for reproductive, excretory, and digestive tracts.
- Describe the path of food from ingestion to digestion in the frog. The frog's mouth leads to the esophagus, which transports food to the stomach. The stomach chemically digests food, and then nutrients are absorbed in the small intestine. Waste is expelled through the large intestine and cloaca. Food enters through the mouth. Travels down the esophagus. Enters the stomach where digestion begins. Passes into the small intestine for nutrient absorption. Waste moves into the large intestine and exits via the cloaca.
- How do the frog's lungs facilitate respiration? The frog breathes through its skin and lungs. The lungs are paired sacs located in the thoracic cavity, connected to the mouth cavity via the glottis. When the frog breathes, air enters through the nares, moves into the oral cavity, and then into the lungs, where gas exchange occurs. The thin walls of the lungs allow oxygen to diffuse into the blood and carbon dioxide to exit.
- Identify the major blood vessels seen in the frog's circulatory system and their functions.
 - Ventricular artery:** Carries oxygen-rich blood from the heart to the body.
 - Vena cavae:** Return deoxygenated blood from the body to the heart.
 - Truncus arteriosus:** Connects the heart to the arteries distributing blood to lungs and body.
- What are the main functions of the frog's kidneys? The kidneys filter waste products from the blood, regulate water and salt balance, and produce urine. They are elongated, dark organs located in the dorsal body cavity and connect to the cloaca via ureters.
