1. Atomic Structure and Periodic Table Review Answer: Atomic Number and Mass: Atomic number defines the element; atomic mass is the weighted average of isotopes. Electron Configuration: Determines chemical properties; electrons occupy orbitals following Aufbau principle. Periodic Trends: Atomic radius decreases across a period due to increasing nuclear charge. Atomic radius increases down a group as additional electron shells are added. Electronegativity and ionization energy follow similar trends, influencing reactivity. Implication for Exam: Understanding these trends aids in predicting element behavior, especially in inorganic reactions and compound formation.

2. Chemical Bonding and Molecular Geometry Review Answer: Types of Bonds: Ionic bonds form between metals and non-metals via electron transfer. Covalent bonds involve shared electron pairs. Metallic bonds feature a 'sea' of delocalized electrons. Molecular Shapes: VSEPR theory predicts geometry based on electron pairs. Examples: Linear: CO_2 Trigonal planar: BH_3 Tetrahedral: CH_4 Pyramidal: NH_3 Bent: H_2O Exam Tip: Be able to draw Lewis structures and predict polarity based on molecular geometry.

3. Organic Chemistry Fundamentals Review Answer: Hydrocarbon Classes: Alkanes: saturated hydrocarbons (single bonds) Alkenes: contain one or more double bonds Alkynes: contain triple bonds Aromatic compounds: benzene ring structure Functional Groups: Alcohols ($-\text{OH}$) Carboxylic acids ($-\text{COOH}$) Amines ($-\text{NH}_2$) Ketones and aldehydes (carbonyl groups) Reaction Mechanisms: Substitution: replacing one atom/group with another Addition: adding atoms across double/triple bonds Elimination: removing groups to form double bonds Condensation: combining molecules with the loss of small molecules like water Exam Tip: Memorize common reaction mechanisms and their conditions, as these often form the basis of exam questions.

4. Inorganic Chemistry and Salts Review Answer: Salt Formation: Acid-base reactions produce salts; e.g., $\text{HCl} + \text{NaOH} \rightarrow \text{NaCl} + \text{H}_2\text{O}$. Complex Ions: Coordination compounds involve central metal ions bonded to ligands. Common Salts: Sodium chloride (NaCl) Potassium sulfate (K_2SO_4) Calcium carbonate (CaCO_3) Properties and Uses: Salts influence solubility and conductivity. Used in pharmaceuticals, water treatment, and industrial processes. Exam Tip: Be familiar with solubility rules and how to write and balance chemical equations involving salts.

5. Pharmaceutical Chemistry: Drug Synthesis and Stability Review Answer: Drug Synthesis: Multi-step reactions often involve protecting groups, catalysts, and specific reaction conditions. Stereochemistry can influence drug efficacy; chiral centers are common considerations. Drug Stability: Factors affecting stability include pH, temperature, light exposure, and humidity. Formulation strategies involve stabilizers, coatings, and storage conditions. Drug-Target Interactions: Binding affinity depends on molecular complementarity. Receptor interactions often involve hydrogen bonds, ionic bonds, and hydrophobic forces. Exam Tip: Understand the principles behind common drug synthesis pathways and stability testing methods.

Analytical Techniques and Their Application in IPC Chemistry Accurate analysis is vital in pharmaceutical chemistry for quality control and research.

1. Spectroscopy UV-Vis Spectroscopy: Used for analyzing conjugated systems and measuring concentrations. Infrared (IR) Spectroscopy: Identifies functional groups based on vibrational frequencies. Nuclear Magnetic Resonance (NMR): Provides detailed information about molecular structure and environment. Mass

Sample Questions and Expert-Backed Answers Below, we present representative questions you might encounter on the Chemistry 1151 GPC final exam, along with detailed explanations and correct answers based on curriculum standards. These serve as a benchmark for preparation.

Question 1: Atomic Structure and Periodic Table

Q: Describe how atomic number and atomic mass influence an element's position in the periodic table.

A: The atomic number, which indicates the number of protons in an atom's nucleus, determines an element's position in the periodic table. Elements are arranged in order of increasing atomic number, which also corresponds to the number of electrons in a neutral atom. The periodic table is structured into periods (rows) and groups (columns), reflecting periodic trends in properties such as electronegativity, atomic radius, and ionization energy. Atomic mass, on the other hand, is not used to position elements but provides information about isotope distribution and atomic weight.

While atomic mass varies among isotopes, the average atomic mass listed in the periodic table reflects the natural isotope abundance. Key Point: Atomic number = position in the periodic table (increases from left to right across periods). Atomic mass provides supplementary data but does not influence element placement.

Question 2: Stoichiometry and Chemical Reactions
Q: Calculate the grams of water produced when 5 grams of hydrogen gas reacts with excess oxygen.
A: The balanced chemical equation for the reaction is: $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$
Step 1: Calculate molar amounts. Molar mass of $\text{H}_2 = 2.02 \text{ g/mol}$. Moles of $\text{H}_2 = 5 \text{ g} / 2.02 \text{ g/mol} = 2.48 \text{ mol}$.
Step 2: Use molar ratio from the balanced equation. 2 mol H_2 produces 2 mol H_2O . Moles of water produced = 2.48 mol (since the ratio is 1:1).
Step 3: Convert moles of water to grams. Molar mass of $\text{H}_2\text{O} = 18.02 \text{ g/mol}$. Grams of $\text{H}_2\text{O} = 2.48 \text{ mol} \times 18.02 \text{ g/mol} = 44.7 \text{ g}$.
Answer: Approximately 44.7 grams of water are produced.

Question 3: Gas Laws
Q: A 2.00 L container holds 1.00 mol of an ideal gas at 25°C. What is the pressure inside the container?
A: Using the ideal gas law: $PV = nRT$
 Where: P = pressure (atm) V = volume = 2.00 L n = 1.00 mol R = 0.0821 L·atm/(mol·K) T = temperature in Kelvin = 25°C + 273.15 = 298.15 K
 Calculating: $P = \frac{nRT}{V} = \frac{(1.00)(0.0821)(298.15)}{2.00} = 12.23 \text{ atm}$
Answer: The pressure is approximately 12.2 atm.

Question 4: Thermodynamics
Q: Explain the significance of enthalpy change (ΔH) in chemical reactions.
A: Enthalpy change (ΔH) represents the heat absorbed or released during a chemical reaction at constant pressure. A negative ΔH indicates an exothermic reaction where heat is released, while a positive ΔH signifies an endothermic process that absorbs heat from the surroundings. Understanding ΔH is vital because it influences reaction spontaneity, energy efficiency, and practical applications such as heating or cooling systems. Enthalpy changes also help compare different reaction pathways and understand bond energies involved.

Key Point: ΔH provides insight into energy flow during chemical transformations.
