Problem: A car accelerates uniformly from a velocity of 20 m/s to 40 m/s in 10 seconds. Calculate the acceleration and the distance covered during this period.
Solution: Initial velocity, $(u = 20, \text{m/s})$ Final velocity, $(v = 40, \text{m/s})$ Time, $(t = 10, \text{seconds})$
 Step 1: Find acceleration, (a) : $a = \frac{v - u}{t} = \frac{40 - 20}{10} = \frac{20}{10} = 2, \text{m/s}^2$
 Step 2: Find the distance covered, (s) , using: $s = ut + \frac{1}{2}at^2$
 $s = (20)(10) + \frac{1}{2}(2)(10)^2 = 200 + 1 \times 100 = 200 + 100 = 300, \text{meters}$
Answer: The acceleration is 2 m/s², and the distance covered is 300 meters.

 $g_{\text{moon}} = \frac{6.674 \times 7.35 \times 10^{11}}{3.017 \times 10^{12}} \approx \frac{49.07 \times 10^{11}}{3.017 \times 10^{12}} \approx 1.62, \text{m/s}^2$
Answer: The acceleration due to gravity on the Moon is approximately 1.62 m/s².

Problem: A parallel plate capacitor with plate area $(A = 2 \times 10^{-4} \text{ m}^2)$ and separation $(d = 2 \times 10^{-3} \text{ m})$ is connected to a 12 V battery. Find the electric field between the plates and the capacitance if the dielectric is vacuum.

Solution:

Step 1: Known Data

- Area, $(A = 2 \times 10^{-4} \text{ m}^2)$
- Separation, $(d = 2 \times 10^{-3} \text{ m})$
- Voltage, $(V = 12 \text{ V})$
- Dielectric constant, $(\kappa = 1)$ (vacuum)

Step 2: Calculate Capacitance

$$C = \frac{\kappa \epsilon_0 A}{d}$$

Where $(\epsilon_0 = 8.85 \times 10^{-12} \text{ F/m})$

$$C = \frac{1 \times 8.85 \times 10^{-12} \times 2 \times 10^{-4}}{2 \times 10^{-3}} = 8.85 \times 10^{-12} \times 10^{-1} = 8.85 \times 10^{-13} \text{ F}$$
 Step 3: Find Electric Field $E = \frac{V}{d} = \frac{12}{2 \times 10^{-3}} = 6000 \text{ V/m}$
 Final Answer: Capacitance $C \approx 8.85 \times 10^{-13} \text{ F}$, Electric Field $E = 6000 \text{ V/m}$

This problem demonstrates practical application of formulas and unit conversions, reinforcing problem-solving skills.

Sample Numerical Problems and Solutions

To illustrate the process, let's analyze some typical numericals encountered in ICSE

Class 10 Physics. Example 1: Calculating Velocity
Question: A car travels a distance of 150 km in 3 hours. Find its average velocity in m/s.
Solution: Given: $s = 150 \text{ km} = 150,000 \text{ m}$, $t = 3 \text{ hours} = 3 \times 3600 = 10,800 \text{ s}$
 Apply: $v = \frac{s}{t}$
 Calculation: $v = \frac{150,000}{10,800} \approx 13.89 \text{ m/s}$
Answer: The average velocity is approximately 13.89 m/s.

Example 2: Refraction and Refractive Index
Question: An incident ray strikes a glass slab at an angle of 30° and refracts at an angle of 20° . Find the refractive index of glass.
Solution: Formula: $n = \frac{\sin i}{\sin r}$
 Values: $n = \frac{\sin 30^\circ}{\sin 20^\circ} = \frac{0.5}{0.3420} \approx 1.46$
Answer: The refractive index of glass is approximately 1.46.

Example 3: Work Done in Moving an Object
Question: A force of 50 N moves a box through a distance of 10 meters in the direction of the force. Calculate the work done.
Solution: Given: $F = 50 \text{ N}$, $s = 10 \text{ m}$, $\theta = 0^\circ$ (since movement is in the same direction)
 Apply: $W = F \times s \times \cos \theta$
 $W = 50 \times 10 \times \cos 0^\circ = 50 \times 10 \times 1 = 500 \text{ J}$
Answer: The work done is 500 Joules.

Question Answer

What is the formula to calculate the potential energy stored in a stretched wire in ICSE Class 10 Physics numericals?

The potential energy (U) stored in a stretched wire is given by $U = \frac{1}{2} \times k \times x^2$, where k is the force constant (spring constant) and x is the extension or compression.

How do you determine the final velocity of a body sliding down an inclined plane with friction, given initial velocity, incline angle, and friction coefficient?

Use the energy or force analysis: $v^2 = u^2 + 2g s \sin\theta - 2\mu g s \cos\theta$, where u is initial velocity, s is the distance moved, θ is the incline angle, and μ is the coefficient of friction.

In a simple pendulum, how is the time period affected if the length of the pendulum is doubled?

The time period T is proportional to the square root of the length ($T \propto \sqrt{l}$). So, if the length is doubled, T increases by a factor of $\sqrt{2}$.

Calculate the work done in stretching a wire by a small extension when the force-extension graph is a straight line.

The work done $W = (1/2) \times \text{Force (F)} \times \text{extension (x)}$. If the graph is linear, the area under the graph (a triangle or rectangle) represents work done.

How can you find the speed of a body after it slides down an inclined plane with friction, given the initial potential energy and work done against friction?

Use energy conservation: $v = \sqrt{2(g h - \text{work done against friction})}$, where h is the height corresponding to potential energy, and work done = friction force $\times$ distance.

In an ICSE numericals problem, how do you calculate the elastic potential energy stored in a stretched wire?

Elastic potential energy = $(1/2) \times k \times x^2$, where k is the spring constant and x is the extension or compression.

What is the relation between the period of a simple pendulum and the acceleration due to gravity, and how is it used in numericals?

The period $T = 2\pi \sqrt{l/g}$. In numericals, rearranging gives $g = (4\pi^2 l) / T^2$ to calculate gravity based on measured period and length.

How do you calculate the power developed in an electric circuit numericals involving work done and time?

Power $P = \text{Work done (W)} / \text{Time (t)}$. In numericals, work done can be calculated as $W = \text{Voltage (V)} \times \text{Current (I)} \times \text{time}$ or using energy formulas.

When calculating the speed of sound in a medium using a numerical problem, what key parameters are needed?

You need the distance traveled by sound (d) and the time taken (t). Speed of sound $v = d / t$. The problem may also involve temperature-dependent formulas if applicable.
